

Britain makes energy storage flywheels

Overview

Giant flywheels are to be installed around the UK to minimise the risk of blackouts as the power system goes carbon-free. Flywheels are energy storage systems that use surplus electricity to accelerate a massive metal "wheel", thereby turning it into mechanical energy.

Britain's new National Energy System Operator (NESO) is reportedly drawing up a plan to fit a string of huge flywheels to the grid to store power and ward off blackouts.

Britain's energy operator is betting on an age-old technology to future-proof its grid, as the power plants that traditionally helped stabilize it are closed and replaced by renewable energy systems.
